

Object-Relational DBMS (ORDBMS) (Self-Learning)

Q. Write a detailed note on Object-Relational Database Management System (ORDBMS). Highlight its features, advantages, and how it differs from a traditional RDBMS.

****Definition to Remember****

An ****ORDBMS**** is a database management system that combines the features of relational and object-oriented databases. It is considered the best of both worlds.

1. Object-Oriented Concepts in Relational Databases

Traditional RDBMS is limited to simple atomic types (integers, strings). ORDBMS adds:

| OOP Concept | Meaning in ORDBMS | Example |

| :--- | :--- | :--- |

2. Features of ORDBMS

1. Complex Data Storage: Stores and queries complex media - audio, video, spatial (GIS) data, large documents.

2. External Storage

3. RDBMS vs ORDBMS

| Feature | RDBMS | ORDBMS |

| :--- | :--- | :--- |

4. Advantages of ORDBMS

* ****Best of Both Worlds:**** Relational reliability + object-oriented flexibility.

* ****RDBMS**** is a database management system that stores data in tables. It is a ****RDBMS**** that translates SQL queries into a form that the database can understand.

****Must-Write Points (for 10 marks)****

1. ORDBMS
