

Serializability & Concurrency Control DBMS

> **Definition:** Serializability is the correctness criterion for concurrent transaction execution. A non-serial schedule is **serializable** if its execution outcome is equivalent to executing the transactions sequentially one after another (a Serial Schedule).

1. Detailed Technical Explanation

1. Types of Schedules:

- **Serial Schedule:** Transactions execute strictly one after another (No interleaving). Guaranteed to be correct, but offers poor CPU utilization.

2. Conflict Serializability:

Two operations O_i and O_j in a schedule are in **conflict** if and only if:

Conflicting Operations Matrix:

3. Precedence Graph (Serialization Graph) Test:

A directed graph $G = (V, E)$ used to test Conflict Serializability:

2. Core Concepts & Memory Keywords

- **Conflict Equivalent:** Two schedules can be transformed into one another by swapping non-conflicting operations.

- **S

3. Must-Write Points for Exams

- A schedule is conflict serializable if it is conflict equivalent to some serial schedule.

- Ch

4. Quick Recall Flow
