

Day 7: Power Query + M Language Mastery

> **Definition to Remember**

> **M**
behind

1. Structure of an M Query: `let ... in`

Every M expression is built around a `let` block (defining step variables) and an `in` block (returning final output):

```
```powerquery
```

let

```
// Step 2: Promote Headers
```

Promo

```
// Step 3: Change Column Types
```

Chang

```
// Step 4: Filter Rows
```

Filtere

## 2. Core M Language Concepts

1. **Case Sensitivity:** Function names and column identifiers are strictly case-sensitive (`Table.SelectRows` != `table.selectrows`).

2. **Im**

## 3. Writing Custom Reusable M Functions

Converting a sequence of cleaning steps into a parameterized reusable function:

```
```pow
```
