

Pentium 4 NetBurst Microarchitecture MPCA Module 6

> **Definition:** The **Intel NetBurst Microarchitecture** is a 7th-generation x86 processor design engineered to achieve ultra-high clock speeds (up to 3.8 GHz) and maximum throughput using a deep **20-stage** (later 31-stage Prescott) Hyper-Pipelined Technology.

1. Detailed Technical Explanation

Functional Components of NetBurst Microarchitecture

...

NETB

2. Deep Dive into NetBurst Innovations

1. Execution Trace Cache (L1 I-Cache Replacement)

- Traditional architectures store raw x86 instructions in L1 instruction cache, requiring repeated decode cycles.

- **T**

2. Hyper-Pipelined Technology (20 to 31 Stages)

- Decomposes instruction processing into 20 distinct pipelined clock stages.

- En

3. Rapid Execution Engine (2x Clock ALUs)

- Integer Arithmetic Logic Units (ALUs) run at **double the core processor frequency**.

- Bas

4. Quad-Pumped System Bus

- Transfers data 4 times per clock cycle over a 64-bit bus, delivering up to **6.4 GB/s memory bandwidth** at 800 MHz FSB.

3. Core Concepts & Memory Keywords

- **NetBurst:** 7th-gen x86 design focused on high clock frequencies.

- **T**
