

Day 23: Power BI Service & Collaboration

📌 Definition to Remember

Power BI Service is the cloud SaaS platform (app.powerbi.com) where published semantic models and reports are organized into workspaces, packaged into enterprise **Power BI Apps**, and shared securely across organizations.

1. Workspaces & Workspace Roles

- **Workspaces:** Staging and development environments for BI teams.

Workspace Role	Permissions & Capabilities
Admin	Full control: delete workspace, manage user access, update gateway connections.
Member	Add/edit reports, build apps, manage permissions for lower roles.
Contributor	Create, edit, and publish reports and datasets (cannot publish apps or manage users).
Viewer	Read-only access: interact with reports and visuals (cannot edit or see underlying DAX).

2. Power BI Apps vs Direct Sharing

- **Power BI App:** The official enterprise distribution mechanism. Packages approved reports into a unified portal with customized left-hand navigation and role-based audience management.
- **Direct Sharing:** Quick sharing with individual email addresses (best for ad-hoc reviews).

3. Automated Subscriptions & Alerts

- Email snapshot subscriptions delivered to executives daily at 8:00 AM.
- Data-driven threshold alerts triggered when KPI metrics breach thresholds.

★ Must-Master Skills & Interview Points

1. Why enterprise deployments distribute reports via **Power BI Apps** instead of giving users direct workspace access.
2. Explaining the 4 Workspace Roles (Admin, Member, Contributor, Viewer).
3. Setting up data-driven alert notifications.

⚡ Quick Recall

Desktop (Author) → Workspaces (Dev Team Roles) → Power BI Apps (End-User Distribution)
