

Flynn's Classification of Computers

Q. Elaborate on Flynn's Classification of computer architectures. Describe SISD, SIMD, MISD, and MIMD with suitable examples.

 **Definition to Remember**

Flynn's Classification (1966) categorizes computer architectures based on the number of concurrent **Instruction Streams (I)** and **Data Streams (D)**. The combinations yield four distinct models: SISD, SIMD, MISD, and MIMD.

1. The Four Categories of Flynn's Taxonomy

Acronym	Full Form	Concept & Working	Example
SISD	Single Instruction, Single Data	The traditional Von Neumann architecture. A single processor executes one instruction stream sequentially on a single data stream.	Early single-core PCs (e.g., Intel 8086, early Pentium).
SIMD	Single Instruction, Multiple Data	A single control unit issues the <i>same</i> instruction to multiple processing units. These units execute the instruction on <i>different</i> pieces of data simultaneously (Data-Level Parallelism).	GPUs (Graphics cards), Vector Processors, CPU multimedia extensions (AVX).
MISD	Multiple Instruction, Single Data	Multiple processors execute <i>different</i> instructions on the <i>same</i> single data stream simultaneously. Highly specialized and rare.	Fault-tolerant systems (e.g., Space Shuttle flight controllers cross-checking data).
MIMD	Multiple Instruction, Multiple Data	Multiple processors fetch their own <i>independent</i> instructions and operate on their own <i>independent</i> data. Represents true Task-Level Parallelism.	Modern Multi-core CPUs (Core i7, Ryzen), distributed supercomputers.

2. Deeper Look at SIMD vs MIMD

- **SIMD** is highly efficient when the exact same operation needs to be applied to a massive array (e.g., adding brightness to a million pixels on a screen). All ALUs do the same math at the same time.
- **MIMD** is the standard for general-purpose computing today. Core 1 might be running a web browser while Core 2 renders a video and Core 3 runs background OS tasks.

★ Must-Write Points (for 10 marks)

1. Flynn's Taxonomy classifies architectures based on **Instruction Streams (I)** and **Data Streams (D)**.
2. **SISD**: Single Instruction, Single Data. Traditional sequential architecture (Older PCs, 8086).
3. **SIMD**: Single Instruction, Multiple Data. Same operation on multiple data pieces (GPUs, Array Processors).
4. SIMD is the basis for **Data-Level Parallelism**.
5. **MISD**: Multiple Instruction, Single Data. Different operations on same data. Very rare (Fault-tolerant systems).
6. **MIMD**: Multiple Instruction, Multiple Data. Independent processors running independent tasks.
7. MIMD is the basis for **Task-Level Parallelism** (Modern multi-core CPUs like Intel i7).

⚡ Quick Recall

Flynn's Tax → SISD (1 Instr, 1 Data, Old PCs) → SIMD (1 Instr, Many Data, GPUs) → MISD (Many Instr, 1 Data, Space Shuttles) → MIMD (Many Instr, Many Data, Multi-core CPUs)
