

Control Unit Architecture & Hardwired/Microprogrammed Control

Q. What is the role of the Control Unit Differentiate between Hardwired Control Unit and Microprogrammed Control Unit.

[DEF] Definition to Remember

The Control Unit (CU) acts as the CPU's manager. It decodes instructions and generates precise control signals that direct the ALU, registers, and data buses. It dictates **what** operations happen and **when**. The two primary design approaches are Hardwired and Microprogrammed.

1. Hardwired Control Unit

The control logic is implemented physically using digital hardware circuits (logic gates, flip-flops, decoders).

* W
signals

2. Microprogrammed (Soft-Wired) Control Unit

The control signals are generated by executing a tiny, low-level program (a Microprogram) stored in a special, fast memory called Control Memory (ROM).

* W
which c

3. Key Differences

Feature	Hardwired CU	Microprogrammed CU
Design Basis	Hardware (Logic gates, circuits)	Software (Microprograms in ROM)
Speed	Very Fast	Slower (due to memory access)
Flexibility	Rigid / Inflexible	Highly Flexible (easy to update)
Cost	High for complex instructions	Cheaper for complex instructions
Processor Type	Used in RISC Architecture	Used in CISC Architecture
Control Memory	Not required	Required (ROM)

[MUST-WRITE] Must-Write Points (for 10 marks)

- Control Unit (CU) manages the CPU by generating timing and control signals.
- Two types: Hardwired (Hardware-based) and Microprogrammed (Software-based).
- Hardwired: Uses logic gates and circuits to generate signals.
- Hardwired is fast but inflexible (requires physical redesign to change instructions). Used in RISC.
- Microprogrammed: Uses microprograms stored in Control Memory (ROM).
- Microprogrammed is flexible (easy to update by changing ROM) but slower. Used in CISC.
- The comparison table clearly showing Speed, Flexibility, and Architecture differences is essential.

[RECALL] Quick Recall

Control Unit -> Hardwired (Hardware, Logic Gates, Fast, Rigid, RISC) vs Microprogrammed (Software/ROM, Microinstructions, Slower, Flexible, CISC)
