

Decomposition Using Multivalued Attribute (4NF) DBMS

> **Definition:** A relation is in **Fourth Normal Form (4NF)** if it is in **BCNF** and for every non-trivial **Multivalued Dependency (MVD)** $X \twoheadrightarrow Y$, **X** is a Super Key.

1. Detailed Technical Explanation

Multivalued Dependency (MVD):

A multivalued dependency $X \twoheadrightarrow Y$ (read as "X multidetermines Y") exists in schema R if the presence of a pair of tuples (t_1, t_2) with $t_1[X] = t_2[X]$ implies that there must also exist tuples t_3 and t_4 combining $t_1[Y]$, $t_2[Y]$, and the remaining attributes $Z = R - (X \cup Y)$.

Example: 4NF Decomposition

Relation STUDENT_INFO(Student_ID, Mobile_No, Skill)

Data Tuple Redundancy (UNF/BCNF Violation):

(Note: Adding 1 new skill for student 101 requires inserting 2 new rows because Mobile_No and Skill are independent!)

4NF Decomposition Algorithm:

Decomposed 4NF Tables:

2. Core Concepts & Memory Keywords

- **Multivalued Dependency (MVD):** Independence between two multi-valued attributes associated with the same key.

3. Must-Write Points for Exams

- 4NF handles independent multi-valued attributes that BCNF cannot resolve.

- MV

4. Quick Recall Flow
