

Topic: Cartesian Product Operation

Q. What is a Cartesian Product in DBMS? Explain its working mechanism and provide an example demonstrating how it combines two relations.

> **Definition to Remember**

> The
of the
column

Cartesian Product Operation ()

- **Binary operation** operates on two tables (which need NOT be union compatible).

- **S**

2. Working of Cartesian Product

- Takes **every single row from A** and pairs it with **every single row from B**.

- Ge

A B :

3. Example

COLORS (2 rows)

| Color_ID | Color_Name |

| :--- | :

SHAPES (2 rows)

| Shape_ID | Shape_Name |

| :--- | :

Query: COLORS SHAPES

Outp

| Color_ID | Color_Name | Shape_ID | Shape_Name |
